CSCI10- Section01-HW9 Karishma Khanna 11/24/18

9.1 Output: This code is outputting the text "We are in CS 10 class!" onto an output file called text.txt, and outputting "Data written to file" on the terminal.

9.2 Output: This code is inputting the first 100 characters of data from each line in the input file text.txt into the char array and outputting each of the first 100 characters onto the terminal (/n is a character too, so really the first 99 characters). It reads until the end of the file. *Note: If there are more than 99+/n characters on a line, the program fails/overflows when you run it.*
